ABSTRACT

Tinnitus is a prevalent auditory disorder characterized by the perception of sound in the absence of an external acoustic stimulus. Ayurveda describes a comparable condition known as *Karna Nāda*, classified under *Karna Roga*, predominantly caused by vitiation of *Vāta dosha*. Classical Ayurvedic texts describe abnormal sound perception in the ear and advocate therapeutic interventions such as *Nasya* and *Karnapurana*. Modern scientific literature attributes Tinnitus to cochlear hair cell damage, altered neural firing, and maladaptive neuroplastic changes in auditory pathways. This review aims to critically analyze the Ayurvedic concept of *Karna Nāda* and correlate it with contemporary scientific understanding of Tinnitus. Classical Ayurvedic treatises and modern biomedical research articles were reviewed to identify similarities in etiopathogenesis, clinical features, and therapeutic approaches.

Significant conceptual parallels were observed between *Karna Nāda* and Tinnitus, indicating the potential role of Ayurvedic therapies as complementary management strategies. However, further well-designed clinical trials are required to establish scientific validation.

KEYWORDS: *Karna Nāda*, Tinnitus, Ayurveda, *Karnapurana*, *Nasya*.

INTRODUCTION

Tinnitus is defined as the perception of sound without an external auditory stimulus and commonly manifests as ringing, buzzing, hissing, or humming sensations. It affects

approximately 10–15% of the adult population and can significantly impair quality of life, leading to anxiety, sleep disturbances, and difficulty in concentration.^[1,2] Despite advances in auditory neuroscience, Tinnitus remains a therapeutic challenge with limited curative options.

Ayurveda describes a similar clinical condition termed *Karna Nāda*, categorized under *Karna Roga* (ear disorders). The term *Nāda* refers to sound, and *Karna Nāda* denotes abnormal sound perception originating within the ear. Classical texts attribute this condition primarily to *Vāta dosha* vitiation affecting the auditory apparatus (*Shrotrendriya*).^[3–5]

Modern neuroscience explains Tinnitus as a disorder involving peripheral and central auditory mechanisms, including cochlear damage, altered neural synchrony, and maladaptive plasticity within auditory cortical networks.^[6,7] Exploring the correlation between *Karna Nāda* and Tinnitus may help in developing integrative management strategies.

AYURVEDIC CONCEPT OF *KARNA NĀDA*

Etiology (*Nidāna*)

According to classical Ayurvedic literature, *Karna Nāda* arises due to factors that aggravate *Vāta dosha*, such as

- Excessive exposure to loud sounds (*Ati-shabda śravaṇa*)
- Aging (*Jara*)
- Excessive physical exertion (*Ati-vyāyāma*)
- Prolonged fasting (*Upavāsa*)
- Psychological stress (*Chinta, Bhaya*)
- Suppression of natural urges (*Vega dhāraṇa*)^[3–5]

These etiological factors closely correspond to modern risk factors including noise exposure, aging, stress, and metabolic exhaustion.

Pathogenesis (*Samprāpti*)

The Ayurvedic pathogenesis of *Karna Nāda* involves

1. *Vāta dosha* aggravation
2. Localization of vitiated *Vāta* in the *Karna pradeśa*
3. Functional obstruction of auditory channels (*Shroto-avarodha*)
4. Degeneration of *Majjā dhātu* (nervous tissue)
5. Perception of *Anāhata śabda* (internal sound).

This description conceptually parallels modern theories of Tinnitus involving neural hyperexcitability and altered auditory signal processing.

Clinical Features

Patients with *Karna Nāda* perceive sounds resembling musical instruments such as *bheri* (drum), *mridanga*, or *shankha* (conch). Based on doshic predominance

- **Vātajā Karna Nāda:** Dryness, pain, intermittent ringing or buzzing
- **Pittajā association:** Burning sensation, sharp or high-pitched sounds
- **Kaphajā association:** Heaviness, dull or low-frequency humming

These variations resemble contemporary Tinnitus classifications based on sound pitch and quality.

Prognosis

Recent-onset *Karna Nāda* is considered *Sādhya* (curable), whereas chronic cases associated with aging or hearing loss are regarded as *Yāpya* (manageable). This aligns with modern observations that chronic Tinnitus is difficult to cure but can be managed symptomatically.

MODERN SCIENTIFIC PERSPECTIVE OF TINNITUS

From a biomedical standpoint, Tinnitus is a multifactorial condition associated with cochlear hair cell damage, synaptic dysfunction, altered neural firing patterns, and maladaptive neuroplasticity in the auditory cortex.^[6-8] Common etiologies include noise exposure, presbycusis, ototoxic drugs, metabolic disorders, and neurological diseases.

Current management strategies include sound therapy, hearing aids, cognitive behavioral therapy, and pharmacological agents. However, these approaches primarily focus on symptom management rather than disease reversal.^[2,9]

AYURVEDIC MANAGEMENT AND CLINICAL EVIDENCE

Karnapurana

Karnapurana involves instillation of medicated oil into the ear canal and is considered a primary therapy for *Vātajā Karna Roga*. Oils provide *Snigdhatā* (unctuousness) and warmth, which pacify *Vāta*, improve local circulation, and reduce neural irritability.

Nasya

Nasya therapy is described as “*Nāsa hi śirasas dvāram*” (nose is the gateway to the head). It is believed to influence cranial nerves and central nervous system functions. Intranasal drug delivery may modulate auditory pathways and limbic structures involved in Tinnitus perception.

Several clinical studies have reported significant improvement in Tinnitus severity following *Karnapurana* and *Nasya* therapies using medicated oils and *ghrita* preparations.^[10–12] However, methodological limitations such as small sample sizes and lack of standard outcome measures are commonly observed.

DISCUSSION

The Ayurvedic concept of *Karna Nāda* and the modern understanding of Tinnitus share notable similarities in symptomatology and pathophysiological mechanisms. Ayurveda emphasizes systemic balance and *Vāta* pacification, while modern medicine focuses on neural mechanisms and auditory processing.

An integrative approach combining Ayurvedic therapies with contemporary Tinnitus management strategies may provide holistic benefits, particularly in chronic cases. Rigorous randomized controlled trials using validated Tinnitus assessment tools are essential for scientific validation.

CONCLUSION

Karna Nāda, as described in Ayurveda, closely correlates with the modern clinical entity of Tinnitus. Ayurvedic interventions such as *Nasya* and *Karnapurana* show potential as complementary management strategies. Integrative research combining Ayurvedic principles with modern neuroscience may enhance understanding and treatment of Tinnitus. Further high-quality clinical studies are warranted.
